Preface	page vii
Acknowledgements	viii
<b>1 Introduction</b>	<b>1</b>
1.1 Bioenergy! Why it's worthwhile	1
1.2 Photosynthesis and fuel production – In a nutshell	3
1.3 Biological energy resources in the past	4
<b>2 Solar energy and photosynthesis</b>	<b>8</b>
2.1 Solar energy – Down to earth	8
2.2 The mechanisms of photosynthesis	15
<b>3 Biomass energy sources</b>	<b>23</b>
3.1 Plant productivity	23
3.2 Biomass wastes	34
<b>4 The bioenergy conversion technologies</b>	<b>40</b>
4.1 An overview	40
4.2 Anaerobic digestion	43
4.3 Alcoholic fermentation	54
4.4 Chemical reduction	74
4.5 Gasification	76
4.6 Pyrolysis	81
4.7 Direct combustion	85
<b>5 The energetics of biomass systems</b>	<b>89</b>
5.1 Net energy	89
5.2 The energy crop plantation	93
5.3 Low intensity biomass systems	98
5.4 Methane via anaerobic digestion	101

vi Contents

5.5 Ethanol via yeast fermentation	105
5.6 A miscellany of fuels from biomass systems	111
<b>6 The economics of biomass systems</b>	<b>115</b>
6.1 General considerations	115
6.2 Net present value	119
6.3 Energy payback time	123
6.4 Some conventional economic costings	127
6.5 Costs of biomass fuels	132
6.6 Relative prices of biological and other fuels	142
<b>7 Present developments and future prospects</b>	<b>147</b>
7.1 The state of the art – An overview	147
7.2 Hydrogen and electricity via biophotolysis – Hope for the future	151
7.3 Petrol pump plants – A dream come true?	155
7.4 Improving plant productivity-I	156
7.5 Improving plant productivity-II	161
7.6 Ligno-cellulose enzyme hydrolysis – Energy-saving biochemistry	165
7.7 Conservation through integration – A systems approach	166
7.8 Biomass potential for national energy autonomy	169
7.9 The biological path to self-reliance	170
References	172
Appendixes	181
1 Conversion factors and orders of magnitude	181
2 Gross energy requirements (GERs) of selected inputs	183
3 Computation of present value	184
Index	189
