

CONTENTS

	Page no.
1. INTRODUCTION	1
1.1 Air flow terminology	2
2. ROLE OF AIR SYSTEMS	4
2.1 Sources of airborne microbial contamination	5
2.2 The importance of air systems in the control of the environment	9
2.3 Different operational states of air systems and their requirements	9
2.3.1 Production	10
2.3.2 Equipment and area cleaning	10
2.3.3 Non-production	10
2.3.4 Maintenance	11
2.3.5 Start-up	11
2.3.6 Process air and air in direct contact with product	11
2.3.7 Operation of the air handling system during cleaning	14
2.3.8 Operation of the air handling system if production continues during cleaning	15
2.4 Process, transport and instrument air	15
2.5 Working conditions	16
2.5.1 People (Control of <i>Legionella</i>)	16
3. SYSTEM DESIGN CONCEPTS	17
3.1 Definitions of product risk categories	17
3.1.1 Air system designed to contribute to good manufacturing practice - GMP areas	18
3.1.2 Air system designed to minimise product contamination - high care areas	18
3.1.3 Air system designed to prevent product contamination - high risk areas	18
3.1.4 Air systems designed to provide process air for aseptic or clean fill operations	19
3.2 Requirements for the working area	20
3.3 Identification of areas where air filtration is not required	23

4.	AIR FILTRATION	26
4.1	Environmental air	26
4.1.1	Environmental air filter types	26
4.1.2	Air filter testing	32
4.1.3	Features and selection	33
4.1.4	Controlled environments (high care and high risk areas)	36
4.1.5	Filter selection check list	39
4.2	Process air	39
4.2.1	Design and application of cartridge filters	40
4.2.2	Performance testing	41
4.2.3	Maintenance	41
5.	DUST CONTROL	44
5.1	Dust control in general	44
5.2	COSHH, local exhaust ventilation and the food industry	44
5.2.1	Assessment of hazards and risks	46
5.2.2	Registration of local exhaust ventilation (LEV) points	46
5.2.3	Maintenance	47
5.2.4	Repairs and modifications	47
5.2.5	Personal protection respirators	48
5.2.6	Personal air samplers	48
5.2.7	Types of dust control equipment	48
5.3	Extraction hood and duct design	50
5.4	Explosion relief	51
5.5	Post installation	51
6.	HUMIDITY CONTROL	52
6.1	Humidification	52
6.2	Dehumidification	53
7.	SYSTEM AND EQUIPMENT CONSTRUCTION	55
7.1	Introduction	55
7.2	Selecting the system	55
7.2.1	System design	57
7.2.2	Recirculated air	57
7.2.3	Closed loop recycled air	57
7.2.4	Heat recovery/energy conservation	58
7.2.5	Zoning and pressure control	59
7.2.6	Air distribution	59
7.2.7	Textile ventilation systems	60

7.3	Selecting the air handling unit (AHU)	69
7.4	Construction of individual components of environmental air handling system	70
7.4.1	Ducts and insulation	70
7.4.2	Special construction considerations for cleaning and disinfection of rigid ducts	71
7.4.3	Grilles	72
7.4.4	Heat exchangers	74
7.4.5	Ceiling mounted chillers	74
7.4.6	Air intake and outlet	74
7.4.7	Silencers or sound attenuators	77
7.4.8	Condensate drains	77
7.5	Installation of environmental air handling equipment	86
7.5.1	Siting of the equipment	86
7.5.2	Prevention of leaks	87
7.5.3	Drainage of liquors	87
7.5.4	User-friendly considerations	87
7.6	Direct process air	87
7.6.1	Process and compressed air	87
	7.6.1.1 Introduction	87
	7.6.1.2 Pipework	88
	7.6.1.3 Control and instrumentation	89
7.6.2	Specific applications	89
	7.6.2.1 Product tanks	89
	7.6.2.2 Typical air volumes required	91
	7.6.2.3 Filtered air to packaging machines	92
	7.6.2.4 Compressed air	92
	7.6.2.5 Air curtains	93
	7.6.2.6 Air barrier control on conveyors	95
7.7	Common design and installation problems and solutions	97
7.7.1	Inadequate air flow into a room	97
7.7.2	Air extraction in wash down areas	99
7.7.3	Air extraction above hot product	99
7.7.4	Air extraction hoods	100
7.7.5	Position of air returns	102
7.7.6	Position of ceiling mounted chillers	102
7.7.7	Effects of doors between low and high care areas	103

8.	TESTING, COMMISSIONING AND VALIDATION	105
8.1	General	105
8.2	Performance criteria	106
8.3	Test procedures	106
8.3.1	System testing	106
8.3.2	Assessment of microbiological performance	108
8.4	System monitoring	108
9.	MAINTENANCE AND SANITATION	110
9.1	Pre-commissioning cleaning	110
9.2	Routine maintenance of the system	111
9.3	Duct cleaning methods	112
9.4	Disinfection of air handling system	112
9.4.1	Introduction	112
9.4.2	Preparation	113
9.4.3	Disinfection by spray lance or fogging	113
9.4.4	Disinfection of air using ultra violet (UV) light	115
9.4.5	Disinfection of air using ozone	116
9.4.6	Disinfection of air using ionisers	117
9.5	Care and maintenance of air filters	117
9.5.1	Indication of fouling	117
9.5.2	Checking	118
9.5.3	Records	118
9.6	Air handling systems and Legionnaires' disease	119
9.6.1	Introduction	119
9.6.2	System design considerations	119
9.6.3	System monitoring points	119
9.6.4	Cleaning and disinfection	120
9.6.5	Ducted air system	120
9.6.6	Chiller batteries	121
9.6.7	Training	121
10.	METHODS OF SYSTEM MONITORING	122
10.1	Physical methods of determining air system performance	122
10.1.1	Temperature	122
10.1.2	Humidity	122
10.1.3	Air flow measurement	122
10.1.4	Pressure measurements	122
10.1.5	Dust and particle measurement	122
10.1.6	Gas testing - oxygen deficiency	130
10.1.7	Monitoring strategies	130

10.2	Methods of determining system cleanliness	130
10.2.1	Methods for assessing surface cleanliness	131
10.2.1.1	Visual	131
10.2.1.2	Wipes	131
10.2.1.3	Vacuum method	131
10.2.1.4	Contact plates	132
10.2.1.5	Swabs	132
10.2.2	Methods for assessing airborne contamination	132
10.2.2.1	Particle counters	132
10.2.2.2	Dust monitors	132
10.2.3	Microbiological methods for assessing airborne contamination	133
10.2.3.1	Sedimentation method	133
10.2.3.2	Impingement/impaction on solid or liquid media	133
10.2.3.3	Filtration methods	134
10.2.3.4	Electrostatic and thermal precipitation	134
11.	ENVIRONMENTAL IMPACT	135
11.1	Odour control	135
11.2	Noise control	135
12.	REFERENCES AND FURTHER READING	136
13.	USEFUL WEBSITES	142
