

CONTENTS

Introduction	5
1. The background to the problem	7
1.1 The problem of protein malnutrition	7
1.2 Availability and consumption of protein	8
2. Methods of approach in the estimation of protein requirements	10
2.1 Introduction	10
2.2 Obligatory nitrogen losses	13
2.3 The nitrogen requirement for growth	17
2.4 Effects of stress in normal populations	17
2.5 Individual variability	18
2.6 The basis of reference: the relationship of protein requirements to body size	18
2.7 Summary of the calculation of requirements	19
3. The requirements of man for reference protein	20
3.1 The protein requirements of children and adults	20
3.2 The protein requirements of infants	22
3.3 Additional requirements for pregnancy and lactation	24
3.4 The effect of climate and heavy work on protein requirements	26
3.5 The effect of pathological states on protein requirements	27
4. Amino acid requirements and amino acid patterns	32
4.1 Introduction	32
4.2 The two-fold nature of the protein requirement	33
4.3 Methods of expressing amino acid pattern	33
4.4 The reference amino acid pattern	35
4.5 Amino acid imbalances	38
4.6 Specific effects of other nutrient deficiencies	39
4.7 The role of non-essential amino acid nitrogen	39
5. Factors affection the protein values of foods	40
5.1 Introduction	40
5.2 The influence of energy supply	41
5.3 Vitamins and minerals as factors in protein utilization	41
5.4 Factors affection the availability of dietary amino acids	42
5.5 The measurement and expression of protein value	42

6. Practical applications	48
6.1 Introduction	48
6.2 Practical allowances	51
6.3 Evaluation of dietary intakes of protein	55
6.4 Practical measures for improving protein quality	56
7. Further research	57
8. Summary	60
References	62
Annex 1. Glossary of terms	65
Annex 2. Method of calculation protein scores with the new essential-amino acid reference pattern	69
Appendix table. Protein in the current food supplies of selected countries based on FAO food Balance sheets	70
