

## CONTENTS

	Page
Preface	v
List of Contributors	vii
1. Introduction	1
2. Methods of Production of fuels from biomass	4
Physical and Physico-chemical methods	4
Biological methods	5
3. The microbiology and biochemistry of anaerobic digestion	10
The microbial population in general	13
The breakdown of carbohydrates	16
The breakdown of nitrogenous compounds	28
The breakdown of fats	31
Minor bacterial reactions	33
Factors affecting the rates of growth and activities of digester bacteria and interactions	
Amongst the bacteria	38
Conclusions	48
4. types of digesters : theoretical aspects and modelling of digester systems and deviations	
from theory	52
Biological models	53
The Engineering Model	84
The Economic Model	87
5. Types of digesters being constructed and the operation of digesters	91
Starting a digestion	91
The single-stage stirred-tank digester	96
The contact digester	116
Anaerobic filters	118
The upflow sludge-blanket digester	119
The fluidised-bed digester	120
Digesters for agricultural wastes and vegetable matter	120
Gas-holders and gas handling	141
Safety precautions and tests with digesters	155
6. Uses of digested sludge	164
Use as fertiliser	165
Use in animal feedstuffs	175
7. Biogas production – laboratory and pilot-plant experiments	181
General – the apparatus	181
Domestic sewage	187
Domestic Garbage	192
Industrial Wastes	196
Agricultural Wastes	203
Conclusions	217
8. Energy production by practical-scale digesters	223
Domestic and municipal sewage	223
Domestic garbage with sewage sludge	228
Other wastes	229
Appendix 1 Photographs of full-scale working digesters	252
Appendix 2 Some estimates of wastes available for biogas or other fuel production	257
Appendix 3 Glossary of terms	260
Index	265
