

## CONTENTS

	Page
Introduction	vii
1. Introducing Methane	1
2. Understanding the Process and its Requirements	6
What can be digested – nutritional needs of the bacteria	10
Acidity and pH Control	13
Temperature and retention time	16
Toxic materials	18
3. Benefits of Anaerobic Digestion	21
Water pollution control	21
Smell and odour control	23
Fertiliser value	24
Pathogen Removal	27
Methane production	28
Self-sufficiency	32
4. Practice	35
Different types and adaptations of the anaerobic digestion process	35
Practical Points of digester operation	48
The digestion tank – Mixing – Scum control	51
Sludge dewatering and further treatment	54
Gas collection and gas holders	58
Temperature control and insulation	61
pH Control	64
Other controls and analyses	65
5. Safety	68
6. Uses for the Gas	72
7. Uses for the Sludge	81
8. Planning a digester	86
Objectives	86
How much waste is produced?	87
How strong is the waste?	91
Sizing the digester	93
Heating and insulation requirements	98
Shape and dimensions – ground area – Choosing a site	102
Digester design – Check list	105
Materials	107
Insulating materials	107
Legal aspects and grants	110
Cost-Benefit analysis	113
9. How Digestion is Practised	116
Research programmes	116
Private digester	122
Commercial organisations	124
Overseas	132

	Other organisations	134
10.	Future Developments and Conclusions	138
	Glossary	141
	Bibliography	144
	Useful equations and conversion factors	146
	Index	148
