

CONTENTS

PART A—MEMBRANES FOR REVERSE OSMOSIS

Reverse Osmosis Application in the Chemical Industry	1
High-Retention, Reverse-Osmosis Desalination Membranes from Cellulose Acetate	17
The Transport of NaCl and Water Through Compressed Hydrophilic Films	27
Composite Cellulose Membranes for Reverse Osmosis	47
Ultrathin Cellulose Across Membrances for Water Desalination	61
Water Transport Across Ultrathin Membranes of Mixed Cellulose Ester and Ether Derivatives	73
Reverse Osmosis Experiments with Graphitic Oxide Membranes	85
Dynamics of Water Transport in Graphitic Acetate: The Swelling Phenomenon	105
Control of Concentration Polarization and Arrest of Fouling of Cellulose Acetate Hyperfiltration Membranes by High Axial Velocity	121
Novel Membranes Prepared by Radiation Grafting of Styrene to Cellulose Acetate	139
Morphology of Modified Cellulose Acetate Membranes	157
Differential Scanning Calorimetry of Cellulose Acetate	169

PART B—MEMBRANES FOR HEMODIALYSIS AND ULTRAFILTRATION

Ultrathin Membranes for Hemodialysis Applications	181
Cellulose Membranes for Hemodialysis: Methods of Improvement	197
Polymeric Parameters of Cellulose Support Media Affection Serum Protein Electrophoresis	211
New Membranes for Hemodialysis	235
Selection of Cellulose Hemodialysis Membranes for Clinical Use: In Vitro Testing Procedures and Their Clinical Significance	251
A Review of Cellulosic Membrane Applications to Air, Water, and Biological Fluids Filtration	267
Statistical Optimization of a Cellulose Membrane	285
Novel Regenerated Cellulose Membranes for the Artificial Kidney	297
Improved Processing of Foods by Reverse Osmosis	309
Reverse Osmosis Treatment of Wastewaters	323
Author Index	335
Subject Index	337
