

CONTENTS

	Page	
I	Introduction	1
II	The Chemical Background to Extraction and Refining	9
	Application of Free energy data	9
	The chloride electropotential series	14
	The fluoride electropotential series	14
	The oxide series	16
	Translation of Free energy data to practice – chemical displacement series	17
	Double decomposition reactions in molten salt mixtures	18
	Solubility in chloride melts	20
	Solubility in liquid magnesium	22
	Deliquescence and hydrolysis	22
	Double and complex salts	23
	Envoi	23
III	Extraction of Magnesium	25
	Occurrence	25
	General considerations	26
	Early electrolytic processes	27
	Requirements for successful electrolysis of $MgCl_2$ in molten chloride baths	30
	Preparation of cell feeds for $MgCl_2$ electrolysis	33
	Modern electrolytic processes	35
	Further development of electrolytic extraction	44
	Types of thermal reduction process	46
	The carbothermic process	50
	The silicothermic process	52
	Further development of the ferrosilicon reduction process	57
	Comparison of the two main routes for magnesium extraction	65
IV	Melting, Alloying and Refining of Alloys not Containing Zirconium	70
	Preliminary look at melting and refining	71
	Development of fluxing procedures	71
	Modern refining techniques	76
	Equipment for melting and casting	78
	The Elektron process for refining magnesium	84
	Alloying with aluminium, Zinc, Manganese and certain minor elements	92
	Fluxes and the mechanism of flux action	94
V	Alloying and Refining of Alloys Containing Zirconium	126
	Introduction	126
	Methods for introducing Zirconium	129
	Fluxes for zirconium alloys	144
	Modern zirconium alloying processes	149
	Alloying rare earth metals and thorium	155
VI	Fluxing Processes Alloying and Chemical Purification : Preparation of High Purity Alloys	157
	Preliminary consideration of alloying by fluxes	157
	Alloying with partially reducible chlorides	158
	Alloying with readily reducible chlorides	159
	Alloying with readily reducible fluorides	167
	Alloying with oxides	170
	Bomb reduction processes for direct production of alloying elements	170

	Incidence of persistent chloride contamination in alloys made by chloride reduction processes	171
	High purity magnesium and magnesium alloys – preliminary considerations	176
	Purity of commercially available magnesium	178
	Iron removal by manganese	180
	Removal of impurities by zirconium	183
	Other precipitation processes	186
	“Inverse setting”	187
	Remelting of high purity alloys	187
VII	Degassing and Grain Refinement	191
	Hydrogen in magnesium not containing zirconium	191
	Degassing processes	196
	Hydrogen in zirconium alloys	199
	Grain refinement of magnesium and its alloys – General considerations	200
	Grain refinement of magnesium by zirconium	200
	Grain refinement of magnesium-aluminium type alloys	200
	Grain refinement of magnesium-zinc alloys	209
	Restriction of grain growth in the solid state	210
VIII	Recovery of Magnesium from Scrap	213
	Scrap recovery processes	213
	Principles of scrap refining	216
	Mechanism of metal recovery from dispersion in a flux bath	216
IX	Alloy System of Practical Interest	218
	Physico-metallurgical considerations	218
	Classification of binary systems	228
	General effects of alloying additions	230
	Mg-Al System	233
	Mg-al-Zn system	241
	Mg-Zn system	249
	Mg-Mn system	251
	Mg-Zr system	254
	Mg-RE system	264
	Mg-The system	268
	Ternary and quaternary systems involving zirconium	269
	Mg-Zn-Zr system	272
	Mg-RE-Zr system	279
	Mg-Th-Zr system	284
	Mg-Zn-RE-Zr system	284
	Mg-Th-Zn-Zr system	288
	Mg-Th-Mn system	294
	Mg-Ag-RE-Zr system	295
	Alloys containing lithium	298
	Binary systems with elements of lesser interest and common impurities	301
X	Cast Alloys in Current Use	308
	Structural alloys for normal temperature use	308
	Alloys for elevated temperature use containing calcium	309
	Alloys containing zirconium for long term use at temperatures up to 250°C	310
	Alloys for long term use above 250°C	310
	Alloys for short term use at elevated temperatures	313
	Scatter in properties	319
	Long term stability of elevated temperature properties	320
	Effects on Tensile Properties of rapid heating and loading	320
	Properties at low temperature	323
	Table of mechanical properties of cast magnesium alloys	324
XI	Sand Casting	342

	General Principles	342
	Moulding sand	342
	Cores	345
	Chills	346
	Running techniques	346
	Founding properties of the various alloys	359
	Casting fluidity and alloy composition	361
	Tendency towards microporosity	362
	Properties obtainable in sand castings	365
	Heat treatment of castings	389
	Inspection of castings	384
	Origin and correction of defects found in castings	387
	Microscopy of non-metallic inclusion	407
	Control of quality of castings	408
XII	Die Casting	419
	Pressure die casting	419
	Gravity die casting	438
XIII	Other Casting Processes and Techniques	442
	Precision sand castings	442
	Water-free binders	443
	Thin walled castings	444
	Acid etching	445
	Plaster (“Antioch”) process	446
	Shell moulding	447
	Investment casting	447
	Shaw process	449
	Coring narrow passageways in sand castings	449
	Porous magnesium	450
XIV	Wrought Alloys in Current Use	452
	British structural wrought alloys for normal temperature use	452
	American wrought alloys for use at normal temperature	455
	Wrought alloys use at elevated temperatures	457
	Directionality of properties	462
	Scatter in properties	462
	Stability of elevated temperature properties	463
	Effects on tensile properties of rapid heating and loading	463
	Properties at low temperature	463
	Tables of mechanical properties of wrought magnesium alloys	465
XV	Metallurgical Background to the Wrought Alloys	483
	Deformation of magnesium	483
	Preferred orientation and directionality of properties	497
	Work hardening	500
	Recovery from cold work : recrystallization and grain growth	515
	Development of high tensile properties at room temperature	516
	Development of long term creep resistance in wrought alloys	523
	Development of good short term tensile and creep properties in wrought alloys	529
	Extrusion of magnesium and magnesium alloy powders	531
XVI	Hot Working the Wrought Alloys : Extrusion, Rolling and Forging	543
	Extrusion	543
	Rolling	550
	Forging	556
	Production of cast stock for working	562
	Inspection and control of quality of cast stock for working	574
	Inspection and control of quality of wrought products	579
XVII	Forming	584

	Effect of temperature on formability and properties	584
	Effect of speed on formability	590
	Types of forming process used for sheet	591
	Forming of extrusions	603
	Section rolling and drawing	603
XVIII	Welding and Other Methods of Joining	604
	Welding	604
	Other Joining processes	636
XIX	Fatigue and Corrosion Fatigue	641
	Results obtained on smooth unnotched specimens in laboratory air	641
	Geometrical factors in fatigue behaviour	650
	Chemical aspects of fatigue and effects of surface protection	655
	Microstructural aspects of fatigue behaviour	663
	Some further aspects of fatigue	666
	Experience with whole components	667
	Diagnosis of fractures in cast magnesium alloys	669
XX	Corrosion and Protection	670
	Corrosion	670
	Protection	697
	Stress corrosion	720
	Cathodic protection with sacrificial magnesium anodes	721
	Magnesium as a battery anode	733
XXI	Relation Between Composition and Physical Properties	736
	Physical property data	736
XXII	Some Engineering Aspects of Design in Magnesium	749
	Main characteristics of magnesium from the point of view of design	749
	Some practical design features	753
	Compressive properties and buckling	761
	Hardness	763
	Bearing strength	764
	Shear strength	765
	Strength-weight ratio	765
	Stiffness-weight ratio	767
	Dent resistance	771
	Damping capacity	771
	Some design aspects applicable to particular modes of fabrication	773
	Relative costs of production processes	778
	Machining	778
XXIII	Magnesium Applications	787
	Introduction	787
	Magnesium in the aeronautics field	788
	Magnesium in the commercial field	827
	Magnesium in the nuclear energy industry	848
XXIV	Metallurgical Background to use of Magnesium in Nuclear Fuel Elements	858
	Development of alloys for nuclear use	858
	Some problems in the production of magnesium nuclear components	873
	Creep, oxidation and some related phenomena	879
	Effects of radiation on some mechanical and chemical properties of magnesium alloys	896
Appendices		
A.	Further notes on the examination of magnesium and its alloys by metallography And related techniques	899
B.	Notes on methods for detecting flux, and chemical procedures for examining Inclusions	908

C. Note on mechanical test data appearing in the book	912
D. Fire precautions	914
E. Further development of cast alloys with high strength/weight ratio:premium quality Castings	919
F. Alloy constitutional diagrams	923
G. Conversion tables for stress and temperature (foldout)	981
Note on Consulting the Index	985
Index	987
