

CONTENTS

	Page
1. Electronic Structure of Metals	1
1.1 Pseudism	1
1.2 Band-Structure Calculations	9
1.3 Analysis of N.F.E. Band structures	17
1.4 Transition and noble metals	25
1.5 Other electronic properties of N.F.E. metals	34
1.6 Cohesion and structure	41
1.7 Landau quasi-particles	55
2. Electronic Structure : the experimental results	62
2.1 Experimental methods	63
2.2 Magnetic phenomena	64
2.3 Non-magnetic phenomena	75
2.4 Summary and Comparison of methods	78
2.5 The derivation of a Fermi surface from geometrical data	80
2.6 The alkalis	83
2.7 The noble metals	89
2.8 'Simple' polyvalent metals	97
2.9 Bismuth	109
2.10 Transition metals	111
3. Metallic electrons in a magnetic field.	113
3.1 Introduction	113
3.2 The free electron	114
3.3 The Bloch electron	118
3.4 Spin-orbit interaction	126
3.5 Magnetic breakdown	129
3.6 Green's function analysis of density of states	139
3.7 Level broadening	142
3.8 Magnetic properties of the conduction electron assembly	145
3.9 The Shoenberg effect	154
3.10 Transport	161
4. Transport properties : surface and size effects	175
4.1 introduction	175
4.2 Internal scattering and surface scattering	176
4.3 D.C. size effect, $H=0$	185
4.4 D.C. size effect, $H \neq 0$	189
4.5 The anomalous skin effect	198
4.6 Cyclotron resonance	209
4.7 A.K.C.R. line-shapes, polarization effects, tipping effects	223
4.8 R.F. size effects	231
4.9 Some propagating modes	241
5. The ordinary transport properties of metals	250
5.1 Electron-phonon interaction : Bloch formulation	251
5.2 Rigid ions and portable pseudo-potentials	253
5.3 Screening the electron-phonon interaction	256
5.4 Vacancy scattering	259
5.5 Impurities	262
5.6 Extended imperfections : stacking faults and dislocations	264
5.7 The Boltzmann equation : 'ideal' resistivity	268

5.8	Heat conduction by electrons	273
5.9	Thermo-electric Power : phonon drag	275
5.10	Thermo-electric power at high temperatures : anisotropy of r	278
5.11	Impurity and imperfection scattering	281
6.	Electronic transport properties of liquid metals	282
6.1	Some simple facts	282
6.2	...and simple theories	283
6.3	The N.F.E. model	287
6.4	Corrections to Ziman's theory	291
6.5	Calculation of the resistivity	296
6.6	Derivatives of the resistivity	300
6.7	Extension of Ziman's theory to liquid alloys	306
6.8	The effect of a magnetic field	311
6.9	The optical properties	312
6.10	Conclusions	315
7.	Experimental studies of the structures of metals and alloys	317
7.1	Introduction	317
7.2	Stability of alloy structures	318
7.3	Alloy chemistry	319
7.4	Magnetic structures	323
7.5	Electron configuration	331
8.	Transition metals Electronic structure of the d -Band Its role in the crystalline and magnetic Structures	340
8.1	Band structure of pure transitional metals	340
8.2	Cohesion and lattice structures in transitional metals	261
8.3	Magnetism of transitional metals	373
	Author index and bibliography	409
	Subject index	425
