

CONTENTS

	Page
1. Introduction	1
2. General methods for replica preparation	3
2.1 Preparation of specimen surface	3
2.2 Details of replication techniques	6
3. General methods for thin film preparation	22
3.1 Initial thinning of bulk material	23
3.2 Final thinning of sheet less than 100 μ thick	25
3.3 Techniques for preparing thin foils from discs 2-3 or 3mm diameter and less than 1.5mm thick	33
3.4 Comparison of electropolishing techniques for thin film preparation	37
3.5 Preparation of thin metal sections by ultra-microtomy	37
4. Selection of method for a particular investigation	39
4.1 Special requirements	39
4.2 Information required and speed of preparation	39
4.3 Recommended techniques for obtaining different types of information	44
5. Tables of replica and thin film methods for a wide range of alloys	44
Appendixes	
1. Useful books and general references	85
2. Method of calculating the lattice parameter from electron diffraction patterns of cubic, Tetragonal, or hexagonal single crystals	87
3. Useful formulae for common lattices	90
4. Angles between crystallographic planes in crystals of the cubic system	92
5. Single crystal electron diffraction patterns with specific zone axes from F.C.C. , B.C.C. And hexagonal structures	95
6. List of suppliers of materials and equipment for the electron metallographic laboratory	97
7. Ancillary equipment for electron microscopes – Essential features and uses	101
