

CONTENTS

1. Development of multicomponent force transfer standards by ONERA for French BNM	1
2. Development , testing and specifications of super precision force transducers for international Comparison measurements	13
3. Measurement of force by means of fiber – optic sensors	23
4. Fiber optic load sensor as a microcomputer peripheral	33
5. A new design for 6 – component force / torque sensors	39
6. A directly weighing suspension balance with frequency variant output	49
7. Microprocessor – based system for belt – scales dosing of mixed feed components	55
8. A contribution to the analysis of conveyor belt weighing errors	65
9. Feeding control of automatic bagging scale	75
10. Weighing in roadvehicles	85
11. In – motion weighing scale and some problems of its metrological evaluation	95
12. 6 – component load cell for automobile wheel	99
13. Measurement uncertainty in the determination of weight and centre of gravity of offshore modules using strain gauge load cells	109
14. The measurement method of big torque moments in drive shafts	119
15. Movable electronic locomotive scale with microprocessor	123
16. Improvement of the weighing accuracy of a 50 KG beam balance	129
17. Decoding of the state of scales equilibrium by microprocessor	139
18. Application of a mew beam type loadcell to mechanical hand	147
19. A new bending test method of leaf springs	153
20. A calibration instrument for roller brake testers	161
21. Characteristic data of force transducers terms and definitions	171
22. A compensating lever and its control system for compensating the force of the frame of a deadweight force standard machine	175
23. Some calibration and test facilities at VSL	187
24. A group verification system for force standard machines using high precision load cells	197
25. Calibration and classification of force transducers by using a traceable set of high – performance facilities	207
26. About the uncertainty of the higher capacity primary standard and the dissemination methods for force transducers	217
27. High accuracy calibration methods for force transducers	227
28. Evaluation of parasitic components on national deadweight force standard machines	237
29. The effect of time response of force transducers on their transfer properties in force comparisons	247

30. Calibration and verification of multicomponent dynamometers in the meganewton range	257
31. Investigation of the calibration signal of force measuring devices	267
32. Eccentric load sensitivity of force sensors	275
33. Ways for the removal of the main disadvantages of force transducers with semiconductors strain gages	283
34. Improving creep performance of the strain gage based load cell	293
35. Temperature effect and compensation of strain gage load cell	303
36. Pilot tests to determine micro – elastic effects in load cell	313
37. Creep of low – range – scales	323
Subject index	331
